

# ***Naming convention changes to 2021 model year LG OLEDs***

This is a summary of potential settings that may require being altered on 2021 model year LG OLED's, but have had their names changed, or have moved location within different sub-menus when compared to previous model years.

Most of the settings that have had their names changed are actually self-explanatory, while some are unnecessarily buried beneath multiple sub-menus. It is up to you, the end user, to check and confirm these settings for yourself and ensure that you account for these differences when following the main calibration guides within this package.

## ***Picture Settings:***

- Aspect Ratio                      16:9                      *Set Just Scan – On*

## ***Additional Settings:***

- Reduce Blue Light                      Off

## ***Advanced Settings:***

- Auto Dynamic Contrast                      Off                      *Under Brightness*
- Peak Brightness                      Off                      *Under Brightness*
- Black Level                      Limited                      *Under Brightness*
- Motion Eye Care                      Off                      *Under Brightness*
- Colour Upgrade                      Off                      *Under Colour -> Fine Tune*
- Sharpness                      0                      *Under Clarity*
- Super Resolution                      Off                      *Under Clarity*
- Noise Reduction                      Off                      *Under Clarity*
- MPEG Noise Reduction                      Off                      *Under Clarity*
- Smooth Gradation                      Off                      *Under Clarity*
- TruMotion                      Off                      *Under Clarity*

## ***General:***

- AI Picture Pro                      Disabled                      *Under AI Service*
- AI Brightness Settings                      Disabled                      *Under AI Service*
- HDMI Deep Colour                      4K                      *Under Devices -> HDMI Settings*

## ***Support:***

- Screen Move                      Off                      *Under Support -> OLED Screen Saver*
- Adjust Logo Brightness                      Off                      *Under Support -> OLED Screen Saver*
- Energy Saving Step                      Off                      *Under Support -> Energy Saving*
- Auto Power Off                      Disabled                      *Under Support -> Energy Saving*

After resetting the 3D LUT from within Device Control Template for LG (2021), the Colour Gamut will be locked and greyed out, and the Gamma will be reset to its factory native state of approximately 2.2. This is normal and it should be left this way during, and after calibration as the 3D LUT you upload later in the process will be performing the colour space mapping and gamma correction.

These two settings can be found in the menus listed below

- Colour Gamut **(2021)**      Locked to Native      *Under Picture -> Advanced Settings -> Colour*
- Gamma **(2021)**      2.2      *Under Picture -> Advanced Settings -> Brightness*

Finally, it should also be noted that when following any Service Menu White Balance calibration guides (*from the links provided within the main guide*), when it comes to 2021 model LG OLED's, the White Balance naming convention within the normal user accessible menus is not the same as with previous years.

Previously, there was the option to select Warm (1, 2 or 3), Medium or Cool, whereas now a numerical slider from Cold 50 through to Warm 50 is provided.

On 2021 model years.....

- |                |        |                      |         |
|----------------|--------|----------------------|---------|
| • Service Menu | Cool   | Relates to User Menu | Cold 50 |
| • Service Menu | Medium | Relates to User Menu | 0       |
| • Service Menu | Warm   | Relates to User Menu | Warm 50 |

The actual Service Menu White Balance Pre-Calibration procedure remains the same as on previous years, but you must ensure that when Pre-Calibrating WARM in the Service Menu, you set the slider to Warm 50 in the User Menu. Likewise, if you Pre-Calibrate COOL in the Service Menu, you should select Cold 50 in the User Menu.

As stated in the main guide, it is highly recommended that all of the information contained within the various links provided if first read, and fully understood before commencing.
